LIFEGENIX INSTITUTE

BASELINE

Comprehensive Longevity Program

A comprehensive, physician-directed preventive health evaluation designed to measure biological aging velocity, assess physiological resilience, and identify silent disease burden—then track whether targeted interventions meaningfully slow biological aging over time.

Program Objectives

- **Optimize health-span and performance**
- **Reduce preventable cardiometabolic and oncologic risk**
- **Preserve long-term function and resilience**

All assessments utilize validated biomarkers, advanced functional testing, genetics, and state-ofthe-art imaging, with longitudinal tracking to ensure accountability and measurable biological improvement.

The Lifegenix Philosophy

Measure Precisely. Intervene Intelligently. Track Relentlessly.

1. **Cellular and epigenetic aging rate**
2. **Cardiovascular structure and vascular aging**
3. **Metabolic, inflammatory, and immune balance**
4. **Sleep quality and recovery capacity**
5. **Gut health, nutrient sufficiency, and systemic regulation**
6. **Early, asymptomatic disease detection**

Data are integrated into a personalized longevity roadmap, with objective tracking to determine whether interventions are improving biological age, resilience, and disease risk.

BLOOD WORK (LABS)

Core Longevity, Metabolic & Genetic Assessment

A. Aging Velocity & Epigenetics

TruDiagnostic TruAge

Biological Aging & Risk:

DunedinPACE; GrimAge / GrimAge2; OMICmAge; organ-specific aging scores; inflammaging index; Telomere length

Quantifies biological aging rate, regenerative capacity, and long-term health risk.

B. Metabolic, Cardiovascular & Inflammatory Risk

Metabolic & Glucose Regulation:
Fasting glucose; fasting insulin; HbA1c; adiponectin; leptin

Advanced Cardiovascular Lipids:
Total cholesterol; LDL-C; HDL-C; triglycerides; ApoB; Lp(a); LDL-P; HDL-P; sdLDL; ox-LDL; Lp-PLA2

Inflammation, Immunity & Blood Health:
CBC with differential; WBC subsets; platelets; RDW; immature granulocytes; nucleated RBCs

C. Hormonal Health

Age-specific metabolic and hormonal response patterns integrated with metabolic, lipid, inflammatory, and organ markers

Evaluates hormonal signaling in the context of aging, performance, and metabolic resilience.

D. Inflammation & Iron Regulation

Systemic & Vascular Inflammation:
hs-CRP; MPO; ESR; IL-6; homocysteine; calprotectin

Iron Status & Gut Barrier Integrity:
Ferritin; serum iron; transferrin saturation; TIBC; RDW; anti-zonulin

E. Genetic Optimization Blueprint

3×4 Genetics

Guides personalization of exercise prescription, nutrient handling, inflammatory bias, detoxification capacity, and neurodegenerative vulnerability patterns.

Genetics inform strategy — they do not predict destiny.

ADVANCED IMAGING & DISEASE DETECTION

Comprehensive Structural Assessment

F. Cardiovascular Structure & Atherosclerosis

Full Body CT

Coronary artery calcium (CAC) score; subclinical coronary artery disease; aortic aneurysms; lung nodules and early lung cancer; vascular narrowing; liver, kidney, pancreatic, adrenal, and abdominal tumors; emphysema and pulmonary scarring

Refines cardiovascular risk beyond biomarkers and detects hidden thoracic and abdominal pathology.

G. Structural Disease Detection

Brain MRI/MRA

Brain MRI / MRA:
Brain tumors and benign masses; white matter disease; microbleeds; aneurysms; AVMs; arterial abnormalities; cerebral volume loss

H. Ultrasound

Thyroid Ultrasound:
Assesses the thyroid gland, to detect cysts, nodules, or enlargement.

Carotid Ultrasound:
Evaluates the carotid arteries for atherosclerosis (plaque buildup) and blood flow velocity.

I. Sleep & Recovery Assessment

WatchPAT One

Sleep architecture; apnea-hypopnea index; oxygen desaturation events

Detects sleep-disordered breathing and impaired recovery that accelerate cardiometabolic disease and aging.

THE OUTCOME

A fully integrated, physician-led longevity assessment that transforms complex biological data into actionable longevity intelligence, enabling early risk detection, precision intervention, and objective tracking of biological improvement over time.
